  Examples of mean and median

  - Review of Chapter 5. using the probability rules

- You need a Calculator for the exam, but ***no*** laptop, ***no*** cellphone, ***no*** blackberry, ***no*** iphone, etc (anything that can transmitting wireless signal is not allowed)

- Location: Memorial Hall,
- Time: Tuesday 5-7pm.

- Talk to me if you have a conflict.

- A Formula sheet, with probability rules and sample mean etc will be available.

- Memorial Hall

- Feb. 23 5-7pm
- Covers up to mean and median of a sample (beginning of chapter 6). But not any measure of spread (i.e. standard deviation, inter-quartile range etc)

Chapter 1-5, 6(first 3 sections) + 23(first 5 sections)

Summarizing Data Numerically

- Center of the data
  - Mean (average)
  - Median
  - Mode (…will not cover)
- Spread of the data
  - Variance, Standard deviation
  - Inter-quartile range
  - Range

Mathematical Notation: Sample Mean

- Sample size n
- Observations $x_1, x_2, \ldots, x_n$
- Sample Mean "x-bar" --- a statistic

$$\bar{x} = (x_1 + x_2 + \ldots + x_n)/n$$

$$= \frac{1}{n}\sum_{i=1}^{n} x_i$$

$\sum$ = SUM

Mathematical Notation: Population Mean for a finite population of size *N*

- Population size (finite) N
- Observations $x_1, x_2, \ldots, x_N$
- Population Mean "mu" --- a Parameter

$$m = (x_1 + x_2 + \ldots + x_N) / N$$

$$= \frac{1}{N} \sum_{i=1}^{N} x_i$$

$$\sum = \text{SUM}$$

Infinite populations

- Imagine the population mean for an infinite population.
- Also denoted by mu or m

- Cannot compute it (since infinite population size) but such a number exist in the limit.
- Carry the same information.

Infinite population

- When the population consists of values that can be ordered
- Median for a population also make sense: it is the number in the middle….half of the population values will be below, half will be above.

Mean

- If the distribution is highly skewed, then the mean is not representative of a typical observation
- Example:

  Monthly income for five persons

  1,000 2,000 3,000 4,000 100,000
- Average monthly income: = 22,000
- Not representative of a typical observation.

- Median = 3000

Median

- The median is the measurement that falls in the middle of the *ordered* sample
- When the sample size *n* is odd, there is a middle value
- It has the ordered index *(n+1)/2*
- Example: 1.1, 2.3, 4.6, 7.9, 8.1

  n=5, (n+1)/2=6/2=3, so index = 3,

  Median = 3rd smallest observation = 4.6

Median

- When the sample size *n* is even, average the two middle values
- Example: 3, 7, 8, 9, *n=4,*

  (n+1)/2=5/2=2.5, index = 2.5

  Median = midpoint between

  2nd and 3rd smallest observation

  = (7+8)/2 =7.5

Summary: Measures of Location

Mean- Arithmetic Average

- Mean of a Sample - $\bar{x}$
- Mean of a Population - $\boldsymbol{\mu}$

Median – Midpoint of the observations when they are arranged in increasing order

Notation: Subscripted variables
n = # of units in the sample
N = # of units in the population
x = Variable to be measured
x_i = Measurement of the *ith* unit

Mode….

Mean vs. Median

Observations	Median	Mean
1, 2, 3, 4, 5	3	3
1, 2, 3, 4, 100	3	22
3, 3, 3, 3, 3	3	3
1, 2, 3, 100, 100	3	41.2

Mean vs. Median

- If the distribution is symmetric, then Mean=Median
- If the distribution is skewed, then the mean lies more toward the direction of skew
- Mean and Median Online Applet

Example

- the sample consist of 5 numbers, 3.6, 4.4, 5.9, 2.1, and the last number is over 10.

(some time we write it as 10+)

- Median = 4.4

- Can we find the mean here? No

Example: Mean and Median

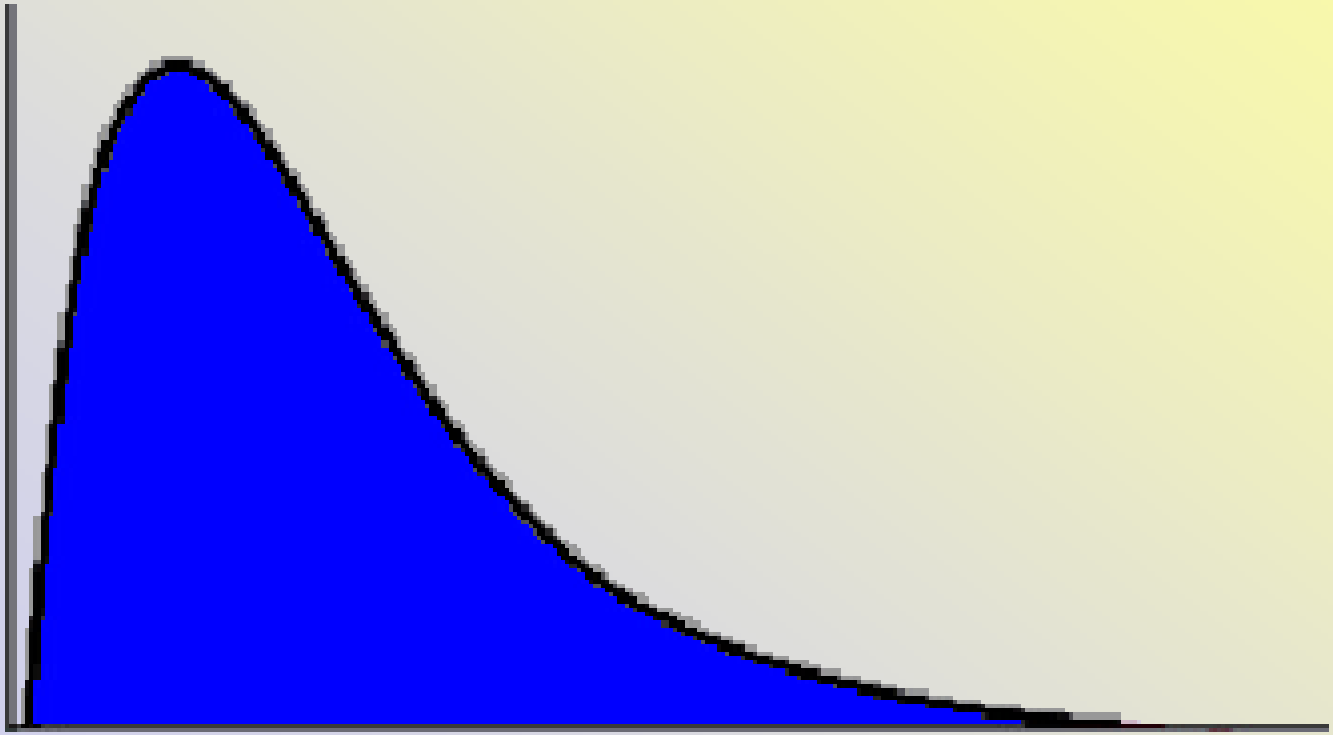
- Example: Weights of forty-year old men

  158, 154, 148, 160, 161, 182,

  166, 170, 236, 195, 162
- Mean =
- Ordered weights: (order a large dataset can take a long time)
- 148, 154, 158, 160, 161, 162,

  166, 170, 182, 195, 236
- Median = 162

Eye ball the plot to find mean/median



- Extreme valued observations pulls mean,

but not on median.

For data with a symmetric histogram,
mean=median.

Using probability rule

- In a typical week day, a restaurant sells ? Gallons of house soup.

- Given that

P(sell more than 5 gallon) = 0.8

P(sell less than 10 gallon) = 0.7

- P(sell between 5 and 10 gallon) = 0.5

Why not always Median?

- Disadvantage: Insensitive to changes **within** the lower or upper half of the data
- Example: 1, 2, 3, 4, 5, 6, 7 vs.

  1, 2, 3, 4, 100,100,100
- For symmetric, bell shaped distributions, mean is more informative.
- Mean is easy to work with. Ordering can take a long time
- *Sometimes*, the mean is more informative even when the distribution is slightly skewed
