Proof by Induction: To prove a statement P(n) is true for all natural numbers n, we can do the following:

- *i.* Prove it is true when n = 1. (Base Case)
- *ii.* Prove that if $k \in \mathbb{Z}$ and P(k) is true then P(k+1) is also true. (the hypothesis of this statement is called the 'inductive hypothesis')

[To complete step 2, remind yourself what you would need to assume and what you would need to show.]

Prove the following theorems using mathematical induction:

1. Theorem A.10: If n is a natural number then

$$1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}.$$

2. Theorem A.18: If n is a natural number then $1 + 2 + 2^2 + \ldots + 2^n = 2^{n+1} - 1$.

3. If n is a natural number then

$$1 + 3 + 5 + \dots + (2n - 1) = n^2.$$

- 4. Theorem A.19: For every natural number n, $1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(n+1)(2n+1)}{6}$.
- 5. Theorem A.21: For every natural number n, $1^3 + 2^3 + 3^3 + \dots + n^3 = (1 + 2 + \dots + n)^2$.
- 6. Theorem 1.18: Let a, b, k, and n be integers with n > 0 and k > 0. If $a \equiv b \pmod{n}$ then $a^k \equiv b^k \pmod{n}$.
- 7. Theorem A.20: For every natural number n > 3, $2^n < n!$.
- 8. For every natural number $n, 8|(3^{2n}-1)$.
- 9. For every natural number n, $\frac{1}{1 \cdot 2} + \frac{1}{2 \cdot 3} + \dots + \frac{1}{n(n+1)} = \frac{n}{n+1}$.
- 10. Let $r \neq 1$ be a real number. For every natural number $n, 1 + r + r^2 + \ldots + r^{n-1} = \frac{r^n 1}{r 1}$
- 11. Binomial theorem. For integers x, y, and $n, (x+y)^n = \sum_{k=0}^n \frac{n!}{k!(n-k)!} x^{n-k} y^k$.
- 12. For every natural number $n \ge 3$, if n distinct points on a circle are connected in consecutive order with straight lines, then the interior angles of the resulting polygon add up to (n-2)180 degrees.

Definition: The *fibonacci numbers* are a sequence of numbers, denoted f_n , defined as follows:

 $f_1 = 1,$ $f_2 = 1,$ and $f_n = f_{n-1} + f_{n-2}$ for $n \ge 3$

Exercise Find the first 10 fibonacci numbers.

- 13. Let f_n be the *n*th fibonacci number. For every natural number n, $f_1^2 + f_2^2 + \cdots + f_n^2 = f_n f_{n+1}$.
- 14. For every natural number n, $(f_n, f_{n-1}) = 1$.

Strong Mathematical Induction To prove a statement using *strong* induction (or the second principle of induction):

- *i*. Prove the base case.
- *ii.* Let $k \in \mathbb{N}$ and assume $P(1), P(2), \ldots, P(k)$ are all true.
- *iii.* Prove P(k+1) is true.

Use strong mathematical induction to prove the following theorems.

15. Let
$$a = \frac{1+\sqrt{5}}{2}$$
 and $b = \frac{1-\sqrt{5}}{2}$. For every natural number $n, f_n = \frac{a^n - b^n}{a - b}$.

- 16. For every natural number $n, f_n < (5/3)^n$.
- 17. Theorem 1.38: Let a and b be integers. If (a, b) = 1, then there exists integers x and y so that ax + by = 1.
- 18. Theorem A.31: Every natural number greater than 7 can be written as a sum of 3's and 5's where the coefficients of 3 and 5 are nonnegative.
- 19. Every natural number n can be written as $n = 2^k l$ where k is a non-negative integer and l is an odd integer.
- 20. Theorem A.30: Every natural number can be written as the sum of distinct powers of 2. (i.e. in the form $n = 2^{i_1} + 2^{i_2} + \cdots + 2^{i_m}$ where $0 \le i_1 < \cdots i_m$ are all integers) Hint: handle the cases where n is even and n is odd separately.
- 21. A country has n cities. Any two cities are connected by a one-way road. Show that there is a route that passes through every city.

Finally...

The Well-Ordering Axiom for the Natural Numbers states that if S is any non-empty subset of natural numbers then S has a smallest element.

22. Show that the principal of mathematical induction follows from the well-ordering axiom.
