Solving Differential Equations (Section 8.1) Alberto Corso (alberto.corso@ukv.edu) Department of Mathematics University of Kentucky February 8 & 10, 2017 Lectures 12 & 13

DEs arise for example in biology (e.g. models of population growth).

economics (e.g., models of economic growth), and many other areas.

exponential growth model:

logistic growth model:

von Bertalanffv models:

Solow's economic growth

model: http://www.ms.ukv.edu/~ma138

Lectures 12 & 13

 $\frac{dN}{dr} = rN$ $N(0) = N_0;$

 $\frac{dN}{dt} = rN\left(1 - \frac{N}{K}\right) \qquad N(0) = N_0;$

 $\frac{dL}{dt} = k(L_{\infty} - L) \qquad L(0) = L_0,$

 $\frac{dk}{dt} = sk^{\alpha} - \delta k \qquad k(0) = k_0.$

 $\frac{dW}{dt} = \eta W^{2/3} - \kappa W \qquad W(0) = W_0;$

MA 138 - Calculus 2 with Life Science Applications

For example **a** $\frac{dy}{dx} + 6y = 7;$ **a** $\frac{dy}{dt} + 0.2 t y = 6t;$ $\frac{dP}{t} = \sqrt{Pt}$; $xy' + y = y^2.$ Differential equations can contain derivatives of any order: for example, $\frac{d^2y}{dx^2} + 6\frac{dy}{dx} = xy$ or y'' + 6y' - xy = 0

is a DE containing the first and second derivative of the function y = y(x).

If a differential equation contains only the first derivative. it is called a **first-order differential equation**: $\frac{dy}{dx} = h(x, y)$.

A differential equation is an equation that contains

an unknown function and one or more of its derivatives.

Example 1 Consider the differential equation $(t+1)\frac{dy}{dt} - y + 6 = 0$.

Differential Equations (≡ DEs)

Which of the following functions

 $v_1(t) = t + 7$ $v_2(t) = 3t + 21$ $v_3(t) = 3t + 9$ are solutions for all t?

http://www.ms.uky.edu/~ma138

http://www.ms.ukv.edu/~ma138

Lectures 12 & 13

We will restrict ourselves to first-order differential equations

Separable Differential Equations

That is, the right-hand side of the equation is the product of two functions, one depending only on x, f(x), the other only on y, g(y). Such equations are called separable differential equations.

This type of differential equations includes two special cases:

(DEs of this form are frequently used in biological models.)

 $\frac{dy}{dx} = f(x) \qquad [i.e., g(y) \equiv 1]$ pure-time differential equations:

autonomous differential equations: $\frac{dy}{dx} = g(y)$ [i.e., $f(x) \equiv 1$]

 $\frac{dy}{dx} = h(x, y)$ of the form $\frac{dy}{dx} = f(x)g(y)$.

Lectures 12 & 13 Example 1 (again)

Solve the differential equation $(t+1)\frac{dy}{dx} - y + 6 = 0$.

http://www.ms.ukv.edu/~ma138

with v(0) = 4.

http://www.ms.uky.edu/~ma138 Lectures 12 & 13

Example 2 (Online Homework # 2)

Solve the following initial value problem

since g[u(x)] = g(y) and u'(x)dx = dy.

In order to solve the separable differential equation

we divide both sides of (*) by g(y) [assuming that $g(y) \neq 0$]:

Now, if y = u(x) is a solution of (*), then u(x) satisfies

 $\left|\frac{dy}{dy} = f(x)g(y)\right|,$

 $\frac{1}{g(y)}\frac{dy}{dy} = f(x).$

 $\frac{1}{\sigma[u(x)]}u'(x) = f(x).$

 $\frac{dy}{dt} + 0.2ty = 6t$

If we integrate both sides with respect to x, we find that $\int \frac{1}{\sigma(u(x))} u'(x) dx = \int f(x) dx \qquad \text{or} \qquad \int \frac{1}{\sigma(v)} dy = \int f(x) dx$

(*)

Such a differential equation is of the form $\frac{dy}{dx} = f(x), x \in I, \qquad y(x_0) = y_0,$ where I is an interval and x represents time; the number x_0 is in the interval I . The solution can then be written as	Suppose that the volume $V(t)$ of a cell at time t changes according to $\frac{dV}{dt} = \sin t \qquad \text{with} \qquad V(0) = 3.$

Autonomous Differential Equations Many of the differential equations that model biological situations are of

the form $\frac{dy}{dx} = g(y)$ where the right-hand side does not explicitly depend on x. These equations

are called autonomous differential equations. Formally, we can solve this autonomous differential equation by separation

of variables. We begin by dividing both sides of the equation by g(y) and multiplying both sides by dx, to obtain $\frac{1}{\sigma(y)}dy = dx.$

Integrating both sides then gives $\int \frac{1}{\sigma(y)} dy = \int dx.$
