In Physics, the work done by a constant force **F** over a distance **d** is given by

 $W = \mathbf{F} \cdot \mathbf{d}$

What if the force varies with position and works over a path $\mathbf{r}(t)$ for $a \le t \le b$?

Over an interval Δt , the force **F**(**r**(t)) does work

 $\Delta W = \mathbf{F}(\mathbf{r}(t)) \cdot (\Delta \mathbf{r})$ $= \mathbf{F}(\mathbf{r}(t)) \cdot \mathbf{r}'(t) \Delta t$

So the work done between t = a and t = b is

$$W = \int_{a}^{b} \mathbf{F}(\mathbf{r}(t)) \cdot \mathbf{r}'(t) \, dt$$

This integral is an example of the *line integral of a vector field*. The line integral of a vector field \mathbf{F} around a curve C is denoted

$$\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r}$$

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Line Integrals

If C is the parametrized path $\mathbf{r}(t)$ with $a \le t \le b$ and

$$\mathbf{F}(x,y,z) = P(x,y,z)\mathbf{i} + Q(x,y,z)\mathbf{j} + R(x,y,z)\mathbf{k}$$

then

$$\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r} = \int_{\mathcal{C}} P \, dx + Q \, dy + R \, dz$$
$$= \int_{a}^{b} \mathbf{F}(\mathbf{r}(t)) \cdot \frac{d\mathbf{r}}{dt}(t) \, dt$$

For vector fields

$$\mathbf{F}(x,y) = P(x,y)\mathbf{i} + Q(x,y)\mathbf{j}$$

and paths in the *xy* plane,

$$\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r} = \int_{\mathcal{C}} P \, dx + Q \, dy$$
$$= \int_{a}^{b} \mathbf{F}(\mathbf{r}(t)) \cdot \frac{d\mathbf{r}}{dt}(t) \, dt.$$

Conservative Vector Fields

Recall that a vector field $\mathbf{F}(x, y)$ is called *conservative* if there is a function $\varphi(x, y)$ so that

$$\mathbf{F}(x,y) = (\nabla \varphi)(x,y) = \frac{\partial \varphi}{\partial x}(x,y)\mathbf{i} + \frac{\partial \varphi}{\partial y}(x,y)\mathbf{j}.$$

What is the line integral of a conservative vector field?

Suppose that $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$, $a \le t \le b$ is a path from $\mathbf{r}(a) = P_0$ to $\mathbf{r}(b) = P_1$ Then

$$\mathbf{F}(\mathbf{r}(t)) = \frac{\partial \varphi}{\partial x}(x(t), y(t))\mathbf{i} + \frac{\partial \varphi}{\partial y}(x(t), y(t))\mathbf{j}.$$

So

$$\mathbf{F}(\mathbf{r}(t)) \cdot \frac{d\mathbf{r}}{dt} = \frac{\partial\varphi}{\partial x}(x(t), y(t)) x'(t) + \frac{\partial\varphi}{\partial y}(x(t), y(t)) y'(t)$$
$$= \frac{d}{dt} \left(\varphi(x(t), y(t), z(t))\right)$$

Integrating along a Closed Curve

If a path C is parametrized by $\mathbf{r}(t)$, $a \le t \le b$ and $\mathbf{r}(a) = \mathbf{r}(b)$, then the path is a *closed path*, and $\int_{C} \mathbf{F} \cdot d\mathbf{r}$ is sometimes denoted $\oint_{C} \mathbf{F} \cdot d\mathbf{r}$.

Suppose that C is a closed path and that **F** is a *conservative* vector field. Find

$$\oint_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r}$$

where C is the closed path consisting of C_1 from P_0 to P_1 and C_2 from P_1 back to P_0

<ロト < 同ト < 回ト < 回ト = 三日 = 三日

Path Independence

A line integral is *path independent* between points P_0 and P_1 if $\int_C \mathbf{F} \cdot d\mathbf{r}$ is the same for *any* path connecting beginning at P_0 and ending at P_1 .

Conservative vector fields are path independent since, for any path C between P_0 and P_1 ,

$$\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r} = \varphi(P_1) - \varphi(P_0).$$

Theorem If the vector field **F** is defined and continuous over all of \mathbb{R}^2 (or \mathbb{R}^3) and $\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r}$ is independent of path between P_0 and P_1 , then for any other point P'_0 , and P'_1 , $\int_{\mathcal{C}'} \mathbf{F} \cdot d\mathbf{r}$ is path independent for any path \mathcal{C}' connecting P'_0 and P'_1 .

Path Independence

Theorem Suppose that **F** is a vector field defined and continuous over all of \mathbb{R}^2 (or \mathbb{R}^3). The following are equivalent:

- (a) **F** is conservative. That is, there is a function φ so that **F** = $\nabla \varphi$.
- (b) $\oint_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r} = 0$ for any closed path \mathcal{C} .
- (c) The integral $\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r}$ is path-independent. That is, for any points P_0 and P_1 , $\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r} = \int_{\mathcal{C}'} \mathbf{F} \cdot d\mathbf{r}$ for any paths \mathcal{C} and \mathcal{C}' from P_0 to P_1 .

Proof:

- (a) \Rightarrow (b): we showed this two slides ago!
- (b) \Rightarrow (c): we'll show this in class
- (c) \Rightarrow (a): we'll show how to get the function φ in class

Puzzler #3

Find a potential for the vector field

$$\mathbf{F}(x, y, z) = (z + e^y)\mathbf{i} + (xe^y - e^z \sin y)\mathbf{j} + (x + e^z \cos y)\mathbf{k}$$

and evaluate $\int_{\mathcal{C}} \mathbf{F} \cdot d\mathbf{r}$ for any path \mathcal{C} between $P_0 = (0, 0, 0)$ and $P_1 = (1, \pi, 0)$.
