Fundamental Theorems

The Fundamental Theorem of Calculus states that

$$\int_{a}^{b} F'(x) \, dx = F(b) - F(a)$$

The Fundamental Theorem for Line Integrals of Conservative Vector Fields states that if C is any curve from P_0 to P_1 , then

$$\int_{\mathcal{C}} (\nabla f) \cdot d\mathbf{r} = \varphi(P_1) - \varphi(P_0)$$

Both of these theorems take the form

00

$$\int_{a \text{ path}} (\text{the derivative of } f) = f \text{ evaluated at the boundary}$$

For the next few weeks we will study new "fundamental theorems" which relate integrals over a *surface* or a *volume* to integrals over their *boundaries*

The Divergence Theorem

Theorem Suppose that **v** is a vector field with continuous first partial derivatives at every point in a bounded volume *V* with piecewise smooth boundary ∂V . Then

$$\iint_{\partial V} \mathbf{v} \cdot \widehat{\mathbf{n}} \, dS = \iiint_V (\nabla \cdot \mathbf{v}) \, dV$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ ▲ □ ● ● ● ●

where $\hat{\mathbf{n}}$ is the outward unit normal to the surface ∂V .

This theorem is due to Carl Friedrich Gauss (German, 1777-1855) and Mikhail Ostrogradsky (Russian-Ukranian, 1801-1862)

Unit C

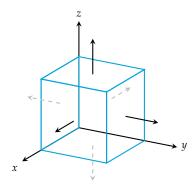

Divergence Theorem

amples

Variations

Reminders

The Divergence Theorem: Example

Suppose *V* is a cube of side *a*.

Then ∂V consists of six faces of the cube with outward normals as shown.

According to the divergence theorem, $\iiint_V (\nabla \cdot \mathbf{v}) \, dV$ is the sum over the six faces F_1, \ldots, F_6 of the fluxes

$$\iint_{F_i} \mathbf{v} \cdot \widehat{\mathbf{n}}_i \, dS$$

(日)

Unit C

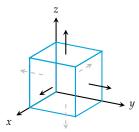

Divergence Theorem

amples

Variations

Reminder

The Divergence Theorem: Proof

One the one hand,

$$\iint_{V} (\nabla \cdot \mathbf{v}) \, dV = \int_{0}^{a} \int_{0}^{a} \int_{0}^{a} \left(\underbrace{\frac{\partial P}{\partial x}}_{(1)} + \underbrace{\frac{\partial Q}{\partial y}}_{(2)} + \underbrace{\frac{\partial R}{\partial z}}_{(3)} \right) dx \, dy \, dz$$

On the other hand,

$$(1) = \int_0^a \int_0^a [P(a, y, z) - P(0, y, z)] dy dz = \text{flux through } x = a \text{ and } x = 0$$

(2) = $\int_0^a \int_0^a [Q(x, a, y) - Q(x, 0, y)] dx dz = \text{flux through } y = a \text{ and } y = 0$
(3) = $\int_0^a \int_0^a [R(x, y, a) - R(x, y, 0)] dx dy = \text{flux through } z = a \text{ and } z = 0$

Suppose that

$$\mathbf{F}(x,y,z)=z\mathbf{k},$$

 ∂V is the sphere

$$x^2 + y^2 + z^2 = a^2,$$

and *V* is the interior of the sphere.

Find the flux of **F** out of *V* first by computing the surface integral $\iint_{\partial V} \mathbf{F} \cdot \hat{\mathbf{n}} \, dS \text{ (challenging!)}$

Hint: The sphere is parameterized by

$$\mathbf{r}(\theta,\varphi) = (a\sin\varphi\cos\theta)\mathbf{i} + (a\sin\varphi\sin\theta)\mathbf{j} + (a\cos\varphi)\mathbf{k}$$

and

$$\mathbf{r}_{\varphi} \times \mathbf{r}_{\theta} = (a^2 \sin \varphi) \frac{\mathbf{r}}{|\mathbf{r}|}$$

Puzzler #1, Continued

Examples

$$\iint_{\partial V} \mathbf{F} \cdot \widehat{\mathbf{n}} \, dS = \iiint_V (\nabla \cdot \mathbf{F}) \, dV$$

$$\mathbf{F}(x,y,z)=z\mathbf{k}$$

V is the sphere of radius *a* centered at the origin

Now compute the flux of **F** out of the sphere by computing the volume integral $\iiint_V (\nabla \cdot \mathbf{F}) \, dV$ (easy!).

$$\iint_{\partial V} \mathbf{F} \cdot \widehat{\mathbf{n}} \, dS = \iiint_{V} (\nabla \cdot \mathbf{F}) \, dV$$

Use the divergence theorem to calculate the flux of **F** across *S* if

$$\mathbf{F}(x, y, z) = z\mathbf{i} + y\mathbf{j} + zx\mathbf{k}$$

and *S* is the surface of the tetrahedron enclosed by the coordinate planes at the plane

$$\frac{x}{3} + \frac{y}{5} + \frac{z}{5} = 1$$

Puzzler #3

$$\iint_{\partial V} \mathbf{F} \cdot \widehat{\mathbf{n}} \, dS = \iiint_{V} (\nabla \cdot \mathbf{F}) \, dV$$

Let

$$\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$$

and let V be the surface bounded by the ellipsoid

$$x^2 + \frac{y^2}{4} + \frac{z^2}{4} = 1$$

Find the flux of **F** out of ∂V . It may be useful to know that the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

has volume $\frac{4}{3}\pi abc$

A Cautionary Tale (Part I)

Suppose that

$$\mathbf{F}(x,y,z) = \frac{1}{|\mathbf{r}|^3}\mathbf{r}$$

where

$$\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}.$$

If *V* is the unit sphere centered at (0, 0, 0), let's find the flux of **F** out of ∂V .

Note that for the unit sphere

$$\int_{\partial V} \mathbf{F} \cdot \hat{\mathbf{n}} \, dS = \int_{|\mathbf{r}|=1} \mathbf{F} \cdot \frac{\mathbf{r}}{|\mathbf{r}|} \, dS$$

0

A Cautionary Tale (Part II)

000000

Examples

$$\iint_{\partial V} \mathbf{F} \cdot \widehat{\mathbf{n}} \, dS = \iiint_V (\nabla \cdot \mathbf{F}) \, dV$$

For the same vector field

$$\mathbf{F}(x,y,z) = \frac{1}{|\mathbf{r}|^3}\mathbf{r}$$

what is $\nabla \cdot \mathbf{F}$?

Write $\mathbf{F}(x, y, z) = (x^2 + y^2 + z^2)^{-\frac{3}{2}}(x\mathbf{i} + y\mathbf{j} + z\mathbf{k}) = P\mathbf{i} + Q\mathbf{j} + R\mathbf{k}$ and compute

$$\frac{\partial P}{\partial x} = (x^2 + y^2 + z^2)^{-\frac{3}{2}} - 3x^2(x^2 + y^2 + z^2)^{-\frac{5}{2}}$$
$$\frac{\partial Q}{\partial y} = (x^2 + y^2 + z^2)^{-\frac{3}{2}} - 3y^2(x^2 + y^2 + z^2)^{-\frac{5}{2}}$$
$$\frac{\partial R}{\partial z} = (x^2 + y^2 + z^2)^{-\frac{3}{2}} - 3z^2(x^2 + y^2 + z^2)^{-\frac{5}{2}}$$

and notice the three components sum to zero, so $\nabla \cdot \mathbf{F} = 0$.

rgence Theorem

les

Variations on the Divergence Theorem

There are several versions of the Divergence Theorem other than the one we've presented today.

If *V* is a solid with surface ∂V , then:

$$\iint_{\partial V} \mathbf{F} \cdot \hat{\mathbf{n}} \, dS = \iiint_{V} (\nabla \cdot \mathbf{F}) \, dV$$
$$\iint_{\partial V} f \, \hat{\mathbf{n}} \, dS = \iiint_{V} (\nabla f) \, dV$$
$$\iint_{\partial V} \, \hat{\mathbf{n}} \times \mathbf{F} \, dS = \iiint_{V} \nabla \times \mathbf{F} \, dV$$

For a better sense of the full sweep of vector calculus, see for example Wikipedia's Vector Calculus Page-scroll down to the secion on Integration
