Abstract

We correct an error in the proof of Theorem 3 in [1] for the case of the column diagonal dominance pivoting.

Theorem 3 in [1] provides the forward error bound for the $LDU$ factorization by Algorithm 1 with either the diagonal pivoting strategy or the column diagonal dominance pivoting strategy. There is an error in the proof for the case of the column diagonal dominance pivoting. Specifically, in line 5 of page 2225, we have used that

$$\frac{a_{ik}^{(k)}}{a_{kk}^{(k)}} \leq \phi(k)\epsilon_1.$$ 

This is true if the diagonal pivoting is used as we have $\hat{a}_{ii}^{(k)} \leq \hat{a}_{kk}^{(k)}$ and hence

$$\frac{|a_{ik}^{(k)}|}{a_{kk}^{(k)}} \leq \frac{\phi(k)\epsilon_1 a_{ii}^{(k)}}{a_{kk}^{(k)}} \leq \frac{\phi(k)\epsilon_1 \hat{a}_{ii}^{(k)} (1 - \xi(k)\epsilon_1)^{-1}}{\hat{a}_{kk}^{(k)} (1 + \xi(k)\epsilon_1)^{-1}} \leq \phi(k)\epsilon_1.$$ 

If the column diagonal dominance pivoting is used, $\hat{a}_{ii}^{(k)} \leq \hat{a}_{kk}^{(k)}$ may not be true. So, Theorem 3 as stated is proved only under the assumption that the diagonal pivoting is used. When the column diagonal dominance pivoting is used, we will show that the theorem is still true if the $\infty$-norm in the bound for $L$ is replaced by the 1-norm. Here we present some additional arguments to prove this case.

Consider the column diagonal dominance pivoting strategy where, at the $k$-th step of the Gaussian elimination, we simultaneously permute the rows and columns so that either the pivot entry

Proof Let \( \hat{a}_{ij}^{(k)} \) follow from Lemma 1. For pivoting, we have assumed that the sign of \( \hat{a}_{ij}^{(k)} \) or diagonal dominance pivoting, i.e., denote the diagonal dominant part for the \( i \)-th column. Let \( \hat{A}^{(k)} \) be the diagonal dominant part for the \( i \)-th column. Then \( \hat{A}^{(k)} \) is already arranged with the column diagonal dominance pivoting, i.e.,

\[
\hat{a}_{kk}^{(k)} = \max \{ \hat{a}_{ii}^{(k)} : \hat{w}_i^{(k)} \geq 0, i \geq k \},
\]

or

\[
\hat{w}_k^{(k)} = \max \{ \hat{a}_{ii}^{(k)} : \hat{w}_i^{(k)} \geq 0, i \geq k \},
\]

where we have assumed that the sign of \( \hat{w}_i^{(k)} \) is correctly computed for determining the column for pivoting.

Recall that \( N \) is the maximal integer such that \( N \leq n - 1 \) and \( a_{\ell \ell}^{(\ell)} > 0 \) for \( 1 \leq \ell \leq N \). We first have the following result.

**Lemma 1** For \( 1 \leq k \leq N \), if \( \hat{A}^{(k)} \) is arranged so that (1) (or (2)) holds, then we have

\[
\sum_{i=k+1}^{n} (|\hat{a}_{ik}^{(k)}| + \hat{v}_i^{(k)}) \leq n(1 + \epsilon_2)\hat{a}_{kk}^{(k)}
\]

**Proof** Let \( \hat{a}_{ii}^{(k)} := \hat{v}_i^{(k)} + \sum_{j=k+1}^{n} |\hat{a}_{ij}^{(k)}| \). Then \( \hat{a}_{kk}^{(k)} = fl\left( \hat{v}_i^{(k)} + \sum_{j=k+1, j \neq i}^{n} |\hat{a}_{ij}^{(k)}| \right) = \hat{a}_{ii}^{(k)} (1 + \epsilon_2) \). It follows from

\[
|\hat{a}_{ik}^{(k)}| + \hat{v}_i^{(k)} = \hat{a}_{ii}^{(k)} - \sum_{j=k+1, j \neq i}^{n} |\hat{a}_{ij}^{(k)}|\]

that

\[
\sum_{i=k+1}^{n} (|\hat{a}_{ik}^{(k)}| + \hat{v}_i^{(k)}) = \sum_{i=k+1}^{n} \hat{a}_{ii}^{(k)} - \sum_{i=k+1}^{n} \sum_{j=k+1, j \neq i}^{n} |\hat{a}_{ij}^{(k)}| = \sum_{i=k+1}^{n} \hat{a}_{ii}^{(k)} - \sum_{i=k+1}^{n} \sum_{j=k+1, j \neq i}^{n} |\hat{a}_{ij}^{(k)}| \leq \hat{a}_{kk}^{(k)} + \sum_{\hat{w}_i^{(k)} \geq 0} \hat{w}_i^{(k)}.
\]
Proof. We only prove the bound (3) for $\nu$ where used so that (1) (or (2)) holds. We have corresponding factors computed exactly. Assume that the column diagonal dominance pivoting is factorization of $D$ dominance pivoting, which replaces the

If using column diagonal dominance pivoting (1), we have

$$
\sum_{i=k+1}^{n} \left( |\tilde{a}_{ik}^{(k)}| + \tilde{v}_{i}^{(k)} \right) \leq \frac{\tilde{a}_{kk}^{(k)}}{a_{kk}^{(k)}} + \sum_{\tilde{a}_{ii}^{(k)} \geq 0} \tilde{a}_{ii}^{(k)} = \frac{\tilde{a}_{kk}^{(k)}}{a_{kk}^{(k)}} (1 + \epsilon_2) + \sum_{\tilde{a}_{ii}^{(k)} \geq 0} \tilde{a}_{ii}^{(k)} (1 + \epsilon_2)
$$

$$
\leq n(1 + \epsilon_2)\tilde{a}_{kk}^{(k)}.
$$

If using column diagonal dominance pivoting (2), we have

$$
\sum_{i=k+1}^{n} \left( |\tilde{a}_{ik}^{(k)}| + \tilde{v}_{i}^{(k)} \right) \leq \frac{\tilde{a}_{kk}^{(k)}}{a_{kk}^{(k)}} + \sum_{\tilde{a}_{ii}^{(k)} \geq 0} \tilde{a}_{ii}^{(k)} \leq \frac{\tilde{a}_{kk}^{(k)}}{a_{kk}^{(k)}} n\tilde{a}_{kk}^{(k)}
$$

$$
= n(1 + \epsilon_2)\tilde{a}_{kk}^{(k)}.
$$

\[\blacksquare\]

We now present the corrected version of Theorem 4 in [1] for the case of column diagonal dominance pivoting, which replaces the $\infty$-norm in the bound for $L$ by the 1-norm.

**Theorem 1** Let $\tilde{L} = [\tilde{l}_{ik}]$, $\tilde{D} = diag\{\tilde{d}_i\}$ and $\tilde{U} = [\tilde{u}_{ik}]$ be the computed factors of $LDU$-factorization of $D(A_D, v)$ by Algorithm 1 and $L = [l_{ik}]$, $D = diag\{d_i\}$ and $U = [u_{ik}]$ are the corresponding factors computed exactly. Assume that the column diagonal dominance pivoting is used so that (1) (or (2)) holds. We have

$$
\|\tilde{L} - L\|_1 \leq \left( n\nu_{n-1} u + O(u^2) \right) \|L\|_1,
$$

(3)

$$
|\tilde{d}_i - d_i| \leq \left( \xi_{n-1} u + O(u^2) \right) d_i, \text{ for } 1 \leq i \leq n,
$$

$$
\|\tilde{U} - U\|_\infty \leq \left( \nu_{n-1} u + O(u^2) \right) \|U\|_\infty,
$$

where $\nu_{n-1} \leq 6 \cdot 8^{n-1} - 2$ and $\xi_{n-1} \leq 5 \cdot 8^{n-1} - \frac{5}{2}$.

**Proof** We only prove the bound (3) for $L$. The proof for other parts is contained in the original proof [1, p.2225]. As in the proof of Theorem 3 in [1, p.2225], using Lemma 5 of [1] and the notations there, we have for $i \geq k + 1$, $|a_{ik}^{(k)}| \leq \tilde{a}_{ik}^{(k)}$ and

$$
|\tilde{l}_{ik} - l_{ik}| \leq \frac{|\tilde{a}_{ik}^{(k)} - a_{ik}^{(k)}|}{a_{kk}^{(k)}} + \frac{\tilde{a}_{ik}^{(k)} u}{a_{kk}^{(k)}}
$$

$$
\leq \frac{|\tilde{a}_{ik}^{(k)}|}{a_{kk}^{(k)}} + \frac{\tilde{a}_{ik}^{(k)} a_{kk}^{(k)} + |\tilde{a}_{ik}^{(k)}| u}{a_{kk}^{(k)}}
$$

$$
\leq \frac{\phi(k) \epsilon_1 (|\tilde{a}_{ik}^{(k)}| + |\tilde{a}_{ik}^{(k)}|)}{a_{kk}^{(k)}} + \xi(k) \epsilon_1 + \epsilon_1
$$

3
where we have used $|\delta^{(k)}_{ik}| \leq \phi(k)\epsilon_1 (|\hat{v}^{(k)}_i| + |\hat{a}^{(k)}_{ik}|)$ which follows from Lemma 5 of [1] as

$$|\delta^{(k)}_{ik}| \leq \phi(k)\epsilon_1 (|\hat{v}^{(k)}_i| + |\hat{a}^{(k)}_{ik}|) + \phi(k)\epsilon_1 (|\delta^{(k)}_i| + |\delta^{(k)}_{ik}|)$$

Now, by Lemma 1, we have

$$\sum_{i=k+1}^n (|\hat{a}^{(k)}_{ik}| + |\hat{v}^{(k)}_i|) \leq n(1 + \epsilon_2)\hat{a}^{(k)}_{kk}. \quad \text{Then}$$

$$\sum_{i=k+1}^n |\hat{a}^{(k)}_{ik} - a_{ik}| \leq \phi(k)\epsilon_1 \sum_{i=k+1}^n \frac{(|\hat{v}^{(k)}_i| + |\hat{a}^{(k)}_{ik}|)}{a^{(k)}_{kk}} + \sum_{i=k+1}^n \xi(k)\epsilon_1 + \sum_{i=k+1}^n \epsilon_1$$

$$\leq \phi(k)\epsilon_1 \frac{n(1 + \epsilon_2)|\hat{a}^{(k)}_{kk}|}{a^{(k)}_{kk}} + (n - 1)\xi(k)\epsilon_1 + (n - 1)\epsilon_1$$

$$= n\phi(k)\epsilon_1 + (n - 1)\xi(k)\epsilon_1 + (n - 1)\epsilon_1$$

where we have used $\hat{a}^{(k)}_{kk} \leq (1 + \xi(k)\epsilon_1)a^{(k)}_{ii}$ and $\nu_{n-1} = 2\phi(n - 1) + \psi(n - 1) + 3$. Since $\|L\|_1 \geq 1$, we have thus $\|\hat{L} - L\|_1 \leq n\nu_{n-1}\epsilon_1\|L\|_1$ and the theorem is proved.
