Newton and Differential Equations

A Differential Equation

What is a differential equation?

A differential equation is an equation relating the quantities x , y and y' and possibly higher derivatives of y .

Examples: $y' = x + y$

$$y'' - y = 0$$

$$(1 + x^2)y'' + 2xy' + 4x^2y = 0$$

Differential Equations

How are differential equations used?

Newton's Second Law:

$$F = ma = \frac{d(mv)}{dt} = m \frac{d^2s}{dt^2}$$

Radioactive decay:

$$\frac{dP}{dt} = -kP$$

Differential Equations

Newton's Law of Cooling:

$$\frac{dQ}{dt} = h \cdot A(T_0 - T_{env})$$

The wave equation:

$$\frac{\partial^2 P}{\partial t^2} = c^2 \nabla^2 u$$

The heat equation:

$$\frac{\partial u}{\partial t} - k \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right) = 0$$

Differential Equations: Modern Solution

Consider the following simple differential equation:

$$\frac{dP}{dt} = k \cdot P$$

Our "modern process" is *Separation of Variables* introduced by l'Hospital in 1750.

Separation of Variables

$$\frac{dP}{dt} = k \cdot P$$

$$\frac{dP}{P} = k \cdot dt$$

$$\int \frac{dP}{P} = \int k \cdot dt = k \int dt$$

$$\ln(P) + C_1 = kt + C_2$$

$$\ln(P) = kt + C$$

$$P(t) = e^{kt+C} = Ae^{kt}$$

Newton's Method of Series

$$\frac{dP}{dt} = k \cdot P$$

Now, assume that we can express P as a function of t by:

$$P(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then $\frac{dP}{dt} = \sum_{n=1}^{\infty} na_n t^{n-1}$ and our first equation gives

We will show later that

$$e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

Therefore,

Solving Algebraic Equations

How can we solve an equation of the following form?

$$y^2 + 3y - 4 - x^2y + 2x = 0$$

For this technique we do the same: assume that y has a power series expansion in terms of x .

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Where does this lead us?

How do we cube out a series? This seems to be the only sticking point to proceeding with this process.

We will make a couple of definitions and assumptions.
