

# The Incircle and Inradius

MA 341 - Topics in Geometry  
Lecture 15

---

---

---

---

---

---

---

---

## Inscribed Circles

- We know that every triangle has a circumscribing circle.
- Does every triangle have an inscribed circle?

---

---

## Incircle, Incenter, Inradius

The three angle bisectors of a triangle are concurrent at a point  $I$ . This point is equidistant from the sides and the circle centered at  $I$  is unique.

---

---

---

---

### Incircle, Incenter, Inradius

We use Ceva's Theorem. We need to show:

$$\frac{BZ}{ZA} \cdot \frac{AY}{YC} \cdot \frac{CX}{XB} = 1$$

Since each is an angle bisector, we know

$$\frac{AY}{YC} = \frac{AB}{BC} \quad \frac{BZ}{ZA} = \frac{BC}{AC} \quad \frac{CX}{XB} = \frac{AC}{AB}$$

30-September-2011 MA 341 001 4

---

---

---

---

---

---

---

---

### Incircle, Incenter, Inradius

$$\frac{BZ}{ZA} \cdot \frac{AY}{YC} \cdot \frac{CX}{XB} = \frac{BC}{AC} \cdot \frac{AB}{BC} \cdot \frac{AC}{AB} = 1$$

By Ceva's Theorem the angle bisectors are concurrent at a point, I.

Drop a perpendicular from I to AC and from I to BC, intersecting at points E and D.

$\angle ECI = \angle DCI$ ,  $\angle IEC = \angle IDC$  and  $IC=IC$ . By AAS  $\triangle IEC = \triangle IDC \Rightarrow IE=ID$ .

30-September-2011 MA 341 001 5

---

---

---

---

---

---

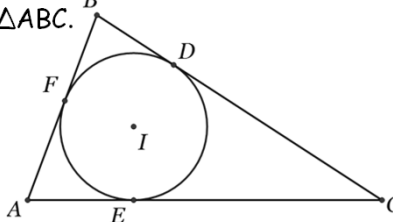

---

---

### Incircle, Incenter, Inradius

Similarly we can show that  $IE=IF$ .

Hence I is equidistant from the sides and there is a circle centered at I that is inscribed in  $\triangle ABC$ .

---

---

---

---

---

---

---

---

### Inradius

Theorem: If  $K$  is the area,  $s$  the semiperimeter, and  $r$  the inradius of  $\triangle ABC$ , then  $K = rs$ .

Consider  $\triangle AIC$ .

$$K_{AIC} = \frac{1}{2}(IE)(AC) = \frac{1}{2}rb$$

Also,

$$K_{AIB} = \frac{1}{2}(IF)(AB) = \frac{1}{2}rc$$

$$K_{BIC} = \frac{1}{2}(ID)(BC) = \frac{1}{2}ra$$

$$K = K_{AIC} + K_{AIB} + K_{BIC} = \frac{1}{2}(a+b+c)r = rs$$

30-September-2011

MA 341 001

7

---

---

---

---

---

---

---

---

### Inradius

$$K = rs.$$

$$r = \frac{K}{s} = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}$$

30-September-2011

8

---

---

---

---

---

---

---

---

### Points of Tangency

Can we find the points of tangency,  $D$ ,  $E$ , and  $F$ ?

We know  $CE=CD$ ,  $AF=AE$  and  $BD=BF$ . Let

$$x = CE = CD$$

$$y = AE = AF$$

$$z = BD = BF$$

$$x + y = b$$

$$x + z = a$$

$$y + z = c$$

30-September-2011

MA 341 001

9

---

---

---

---

---

---

---

---

### Points of Tangency

Solving, we get:

$$x = \frac{a+b-c}{2} = s-c$$

$$y = \frac{b+c-a}{2} = s-a$$

$$z = \frac{a+c-b}{2} = s-b$$

30-September-2011

10

---

---

---

---

---

---

---

---

### Extension: Tangent Circles

If we have three mutually, externally, pairwise tangent circles, then their common tangent lines are concurrent.

30-September-2011

MA 341 001

11

---

---

---

---

---

---

---

---

BD and CD are perpendicular to the common tangent through D.

Thus,  $D \in BC$ ,  $F \in AB$ ,  $E \in AC$

Now,  $AF=AE$ ,  $BF=BD$ , and

$CE=CD$ . We see

That D,E,F are points of tangency of the incircle of  $\triangle ABC$

---

---

---

---

---

---

---

### More from Incircle

Law of Tangents: If  $a, b, c,$  and  $s$  are as usual, then

$$\tan\left(\frac{C}{2}\right) = \sqrt{\frac{(s-a)(s-b)}{s(s-c)}}$$

In  $\triangle CIE,$

$$\begin{aligned} \tan\left(\frac{C}{2}\right) &= \frac{IE}{CE} = \frac{r}{s-c} \\ &= \sqrt{\frac{(s-a)(s-b)}{s(s-c)}} \end{aligned}$$

---

---

---

---

---

---

---

---

### Incenter Coordinates

Cartesian coordinates

If  $A=(x_a, y_a), B=(x_b, y_b), C=(x_c, y_c)$  and sides are  $a, b, c$  then

$$I = \left( \frac{ax_a + bx_b + cx_c}{a+b+c}, \frac{ay_a + by_b + cy_c}{a+b+c} \right)$$

---

---

### Incenter and Euler Segment

30-September-2011

MA 341 001

15

---

---

---

---

---

---

---

---

## Euler's Theorem

Let  $d=OI$ , the distance from the circumcenter to the incenter.

$$d^2 = R(R-2r)$$

where  $R$ =circumradius and  $r$ =inradius.

30-September-2011

MA 341 001

16

---

---

---

---

---

---

---

---

## Circumcenter Coordinates

Cartesian coordinates

If  $A=(x_a, y_a)$ ,  $B=(x_b, y_b)$ ,  $C=(x_c, y_c)$  and sides are  $a, b, c$  then

$$C = \left( \frac{(x_a^2 + y_a^2)(y_b - y_c) + (x_b^2 + y_b^2)(y_c - y_a) + (x_c^2 + y_c^2)(y_a - y_b)}{2(x_a(y_b - y_c) + x_b(y_c - y_a) + x_c(y_a - y_b))}, \right. \\ \left. \frac{(x_a^2 + y_a^2)(x_c - x_b) + (x_b^2 + y_b^2)(x_a - x_c) + (x_c^2 + y_c^2)(x_b - x_a)}{2(x_a(y_b - y_c) + x_b(y_c - y_a) + x_c(y_a - y_b))} \right)$$

30-September-2011

MA 341 001

17

---

---

---

---

---

---

---

---

## Centroid Coordinates

Cartesian coordinates

If  $A=(x_a, y_a)$ ,  $B=(x_b, y_b)$ ,  $C=(x_c, y_c)$  then

$$G = \left( \frac{x_a + x_b + x_c}{3}, \frac{y_a + y_b + y_c}{3} \right)$$

30-September-2011

MA 341 001

18

---

---

---

---

---

---

---

---

### Orthocenter Coordinates

Cartesian coordinates  
 If  $A=(x_a, y_a)$ ,  $B=(x_b, y_b)$ ,  $C=(x_c, y_c)$  then

$$H = (x_H, y_H)$$

$$x_H = \frac{(y_b - y_c)y_a^2 + (y_c - y_a)y_b^2 + (y_a - y_b)y_c^2 + x_a y_a(x_b - x_c) + x_b y_b(x_c - x_a) + x_c y_c(x_a - x_b)}{y_c x_b + y_b x_c + y_a x_a - x_b y_c - x_c y_b - x_a y_b}$$

$$y_H = \frac{(x_c - x_b)x_a^2 + (x_b - x_a)x_c^2 + (x_a - x_b)x_b^2 + x_a y_a(y_c - y_b) + x_b y_b(y_a - y_c) + x_c y_c(y_b - y_a)}{y_a x_b + y_b x_c + y_c x_a - x_b y_c - x_c y_a - x_a y_b}$$
