MA162: Finite mathematics

Jack Schmidt

University of Kentucky

March 10, 2010

Schedule:

- HW C1 is due Monday, Mar 29th, 2010.
- HW C2 is due Monday, Apr 5th, 2010.
- HW C3 is due Sunday, Apr 11th, 2010.
- Exam 3 is Monday, Apr 12th, 5:00pm-7:00pm.
- No class Mar 15th, Mar 17th (Spring Break)

Today we will cover 5.1: simple and compound interest. We will be using calculators today.

5.1: Interest

- Businesses often need short-term use of expensive assets, so find renting attractive (often tax-deductible)
- Sometimes what a business needs most is just cash. In a small business, you don't make money every day. A successful small business does make money, so can repay the money in the future.
- How can they rent cash?
 Why would somebody give them money today?
 For the promise of more money in the future. Interest
- How much more?
 - The more money being loaned, the more interest. Principal
 - The longer the money is loaned, the more interest. Time

• For short term loans, people use a simple model for interest

$$I = Prt$$

- There is the **Principal**, the amount of money borrowed, like \$100
- There is a rate of interest, like 10% per year
- There is a time period, after which the money is due, like 1 year
- There is the Interest, the extra money due at the end,

like $($100) \cdot (10\% \text{ per year}) \cdot (1 \text{ year}) = $10.$

5.1: Simple interest examples

$$I = Prt$$

• If \$100 is lent at 10% interest per year for six months, then

$$I = (\$100) \cdot (10\% \text{ per year}) \cdot (\frac{1}{2} \text{ year}) = \$5$$

• If \$100 is lent at 7% interest per year for three months, then

$$I = (\$100) \cdot (7\% \text{ per year}) \cdot (\frac{1}{4} \text{ year}) = \$1.75$$

• If \$325 is lent at 12% interest per year for five months, then

$$I = (\$325) \cdot (12\% \text{ per year}) \cdot (\frac{5}{12} \text{ year}) = \$16.25$$

5.1: More examples

- What is the simple (yearly) interest rate if \$100 is loaned for 3 months with \$5 interest due?
- If the interest rate is 7% and \$9.10 interest is due after three months, how much was loaned?
 - $\begin{array}{ll} r &= 7\% \mbox{ per year } & I &= \mbox{ Prt } \\ t &= 1/4 \mbox{ year } & \$9.1 &= \mbox{ P}(7\%)(1/4) \\ I &= \$9.10 & \$36.4 &= \mbox{ P}(7\%) \\ P &= ? & P &= \$36.4/7\% = \$520 \\ \end{array}$

5.1: Simple interest as rent

- Simple interest treats loaned money like a loaned house.
- Every month you pay money to borrow the house, and at the end of the year you give the house back.
- The owner goes without his house for a year, but receives money in exchange (rent). The lender goes without his money for a year, but receives money in exchange (interest).
- How much rent do you pay total? If each month you pay \$300, then by the end of the year, you've paid (12)(\$300) = \$3600.
- This calculation is similar to the interest calculations we just did. Each month you pay $(\$100) \cdot (12\% \text{ per year})(\frac{1}{12} \text{ year}) = \1 interest, and at the end of the year that is (12)(\$1) = \$12, or 12% of the original loan.

5.1: Got no money to pay the rent

- What happens when you cannot pay the rent? Well, typically lots of bad things.
- What if you borrow the rent from your friend? Maybe he charges interest too.
- What if you can't pay back your friend? Maybe you borrow from another friend, and maybe they charge interest too.
- Interest on interest is called compound interest
- In finance and economics, nearly all interest is compound
- Simple interest is used for short-term loans

5.1: Three Brothers Loans and Cement Mixing, LLC

- Harry, Gary, and Scary run a limitedly legal company specializing in short term loans
- In January, Bob borrowed \$100 from Harry for one month at 10% per month interest
- In February, Gary stopped by to say hello, and that his brother was anxious for his \$110
- Bob didn't have the \$110, but Gary said he looked like a nice guy and would loan him the \$110 at 10% per month interest.
- Bob asked if Gary minded giving Harry the money, since they were brothers, and so Gary took back the money immediately and went back to the cement yard.

5.1: Three Brothers Loans and Cement Mixing, LLC

- In March, Scary stopped by to say hello, and that his brother was anxious for his \$121
- Bob didn't have the \$120, wait, \$121?
- If Bob had borrowed \$100 for 2 months at 10% per month interest, then he would owe:

 $100 + (100) \cdot (10\% \text{ per month}) \cdot (2 \text{ months}) = 100 + 20$

However, he had borrowed \$110 from Gary for 1 month at 10% per month interest, so he owed:

 $110 + (10\% \text{ per month}) \cdot (1 \text{ month}) = 110 + 11$

 Scary had no interest in the math, only in the interest, \$10 from the first month, \$11 from the second

5.1: Compound interest

• The most basic formula for compound interest is:

$$A = P(1+i)^n$$

- the **Principal** is the amount initially borrowed, like \$100
- the interest rate per compounding period, like 10% per month
- the **number** of compounding periods that have passed, like 2 months
- the **Accumulated Amount** of money due, both the principal and the interest, like

 $(\$100)(1+10\%)^2 = (\$100)(1.10)^2 = \$121$

5.1: Compound interest examples

$$A = P(1+i)^n$$

 If you borrow \$100 at 10% per month, compounded monthly, for six months you owe

$$(\$100) \cdot (1.1)^6 \approx \$177.16$$

• If you borrow \$100 at 10% per month, compounded monthly, for nine months you owe

$$(\$100) \cdot (1.1)^9 \approx \$235.79$$

 If you borrow \$100 at 10% per month, compounded monthly, for twelve months you owe

$$(\$100) \cdot (1.1)^{12} \approx \$313.84$$

5.1: Why does the formula work?

• If you borrow \$100 at 10% per month, compounded monthly, for one month you owe

 $100 + (100)(10\%) = (100) \cdot (1 + 10\%) = (100) \cdot (1.1) = 110$

• If you borrow it for another month, you owe

$$110 + (110)(10\%) = (110)(1 + 10\%) = (110)(1.1)$$

= (100)(1.1)(1.1) = (100)(1.1)² = 121

• If you borrow it for another month, you owe

$$(1.1)^{3} = (1.1)^{10} = (1.1)^{11} = (1.1)^{3} = (1.1)^{11}$$

= $(1.1)^{2} = (1.1)^{11} = (1.1)^{3}$

5.1: Confusing customers for fun and profit

- Stating interests rates in terms of months, fortnights, or furlongs makes it hard to compare interest rates
- A simple way to handle this is to multiply the rate by how many periods there are per year, to "convert" to a yearly rate, like (10% per month) · (12 months per year) = 120% per year
- The **nominal rate** is this rate, "120% interest per year, compounded monthly"
- To convert from a nominal rate to a per-period rate just divide by the number of periods
- a nominal rate of 12% per year compounded monthly is a rate of (12% per year)/(12 months per year) = 1% per month

5.1: Confusing customers for fun and profit

- However, what happens to Bob (best-case scenario) if he continues to get loans from the three brothers?
- The nominal rate was 120% per year, compounded monthly

Jan	Feb	Mar	Apr	May	Jun
\$100	\$110	\$121	\$133.10	\$146.41	\$161.05
Jul	Aug	Sep	Oct	Nov	Dec
\$177.16	\$194.87	\$214.36	\$235.79	\$259.37	\$285.31
Jan \$313.84	= \$100 +	\$213.84			

• "120% per year compounded monthly" fails to capture the "213.84% per year simple interest"

5.1: Effective interest rate

- In the U.S. the 1968 Truth in Lending Act required lenders to advertise the **effective** annual percentage rate
- The true calculation is complicated, depends on your jurisdiction, and takes into account certain fees and penalties.
- In MA162, the formula is not so complicated. You just calculate the interest for one year.
- For instance, the three brothers nominal rate of 120% resulted in

$$(1+\frac{1.20}{12})^{12}-1 = (1+0.10)^{12}-1 = 1.1^{12}-1 \approx 2.13843 = 213.843\%$$

In general

$$r_{eff} = (1 + \frac{r}{m})^m$$

5.1: Summary

- Today we learned simple interest, compound interest, and the effective interest rate.
- We used the words interest, principal, interest rate, compounding period, nominal rate, accumulated amount.
- You are now ready to complete HWC1 #s 1,5,6,7,8,9,10,12,13
- Make sure to take advantage of office hours, and have your questions ready for your next recitation
- Quiz time!
