MA162: Finite mathematics

Jack Schmidt

University of Kentucky

October 31, 2011

SCHEDULE:

- HW 6A is due Friday, Nov 4th, 2011.
- HW 6B is due Wednesday, Nov 9th, 2011.
- HW 6C is due Friday, Nov 11th, 2011.
- Exam 3 is Monday, Nov 14th, 5:00pm-7:00pm in CB106.

Today we will cover 6.1: Sets

Exam 3 breakdown

- Chapter 5, Interest and the Time Value of Money
 - Simple interest
 - Compound interest
 - Sinking funds
 - Amortized loans
- Chapter 6, Counting
 - Inclusion exclusion
 - Inclusion exclusion
 - Multiplication principle
 - Permutations and combinations

6.1: Life before sets

- We are going to be doing some hard counting problems.
- To make it easier, we need to be able to talk about the things we are counting.
- When we counted money, or acres, or ounces of jamba juice we had variables to denote the number. x = 5 acres, or y = 10 ounces.
- If you had \$5 in one bank account and \$10 in another, you had 5+10 = 15 total. The numbers were all that mattered.
- Unfortunately life rarely divides nicely into separate accounts, and numbers cannot describe many of these aspects.

6.1: More than numbers can say

- We are going to be counting more complicated things now.
- If your friend Jimmy says you can borrow their car Monday,
 Tuesday, and Wednesday, then that is 3 days you've got a car.
- If your friend Timmy says you can borrow their car Tuesday, Thursday, and Friday, then that is 3 days you've got a car.
- How many days total can you borrow a car?

6.1: More than numbers can say

- We are going to be counting more complicated things now.
- If your friend Jimmy says you can borrow their car Monday,
 Tuesday, and Wednesday, then that is 3 days you've got a car.
- If your friend Timmy says you can borrow their car Tuesday, Thursday, and Friday, then that is 3 days you've got a car.
- How many days total can you borrow a car?
- Well, Monday, Tuesday, Wednesday, Thursday, Friday is five days.
- But $5 \neq 3 + 3$. Numbers are not enough.

6.1: Sets to name the things we are counting

• If we let J be the days Jimmy lets us have the car, then

$$J = \{ Monday, Tuesday, Wednesday \}$$

• If we let T be the days Timmy lets us have the car, then

$$T = \{ \text{ Tuesday, Thursday, Friday } \}$$

 The days when at least one of them let us use the car is the union of the two sets

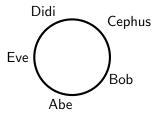

$$J \cup T = \{ Monday, Tuesday, Wednesday, Thursday, Friday \}$$

 The days when both of them let use the car is the intersection of the two sets

$$J \cap T = \{ \text{ Tuesday } \}$$

6.1: Counting cards

• Five friends are playing cards with a standard 52 card deck

• The deck has the following cards:

- 50 cards have been dealt out, 10 to each person
- Why must one of the suits $(\heartsuit, \diamondsuit, \clubsuit, \spadesuit)$ be completely dealt out?

6.1: Counting

- Five friends are playing cards with a standard 52 card deck
- 50 cards have been dealt out, 10 each
- Which of the following are true:
- (L) At least two people have at least one clubs .
- (R) At least one person has at least two clubs ♣
- (B) Both

6.1: Fancier counting

- Which of the following are true:
- (L) Every player has at least 3 of the same suit
- (R) Some pair of neighbors has at least 6 of the same suit (combined)
- (B) Both
- In "R" it counts if one player has 6 of the same suit by themselves

6.1: More sets

• We can have sets of numbers $A = \{1, 2, 3\}$ and $B = \{3, 4, 5\}$, then:

•
$$A \cup B = \{1, 2, 3, 4, 5\}$$

•
$$A \cap B = \{3\}$$

- $A B = \{1, 2\}$ is the difference, the things in A that are not in B
- We can write down sets in funny ways:

$$A = \{3, 2, 1\} = \{1, 1, 1, 1, 1, 2, 2, 3\}$$

 We can describe them in words, "A is the set of positive integers whose square is a one digit number."

6.1: Equality drill

- Two sets are **equal** if they have the same elements.
- $\{1,2,3\} \stackrel{?}{=} \{1,2,3\}$

- $\bullet \ \{1,2,3\} \stackrel{?}{=} \{1,2,2,3,3,3\}$
- $\{1,2,3\} \stackrel{?}{=} \{$ positive integers whose square has one digit $\}$
- $\{1,2,3\} \stackrel{?}{=} \{ \text{ odd numbers less than 4 } \}$

6.1: Equality drill

- Two sets are equal if they have the same elements.
- $\{1,2,3\} = \{1,2,3\}$ **Yes!** Exactly the same.
- $\{1,2,3\} \neq \{1,2\}$ **No!** Right hand set is missing "3"
- $\{1,2,3\} = \{3,1,2\}$ Yes! Order does not matter.
- $\{1,2,3\} = \{1,2,2,3,3,3\}$ Yes! Repeats don't matter.
- $\{1,2,3\} = \{$ positive integers whose square has one digit $\}$ Yes! Long-winded doesn't matter.
- $\{1,2,3\} \neq \{$ odd numbers less than 4 $\}$ No! Right hand set is missing "2"

6.1: Union and intersection drill

ullet The **union** includes anything in either, and is big.

● ↑ The **intersection** includes only those in both, and is small. ↑

 $\bullet \ \{1,2,3\} \cup \{3,4,5\} =$

 $\bullet \ \{1,2,3\} \cap \{3,4,5\} =$

 $\bullet \ \{1,2,3\} \cup \{1\} =$

6.1: Union and intersection drill

- ullet The **union** includes anything in either, and is big.
- \bullet $\ \bigcap$ $\$ The intersection includes only those in both, and is small. $\ \bigcap$
- $\bullet \ \{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\}$
- $\{1,2,3\} \cap \{3,4,5\} = \{3\}$
- $\bullet \ \{1,2,3\} \cup \{1\} = \{1,2,3\}$

6.1: Difference drill

• The **difference** keeps the first, but not in the second.

6.1: Difference drill

- The difference keeps the first, but not in the second.
- $(1,2,3) \{1\} = \{2,3\}$
- $\bullet \ \{1,2,3\} \{3,4,5\} = \{1,2\}$
- $\bullet~\{1,2,3\}-\{1,2,3\}=\{\}~$ The empty~set containing nothing.

```
• \{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\}, but what about \{3,4,5\} \cup \{1,2,3\}?
```

$$\begin{array}{l} \bullet \ \{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\}, \\ \{3,4,5\} \cup \{1,2,3\} = \{1,2,3,4,5\} \end{array}$$

Order of union does not matter

•
$$\{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\},\$$

 $\{3,4,5\} \cup \{1,2,3\} = \{1,2,3,4,5\}$

- Order of union does not matter
- What about $\{1,2,3\} \cap \{3,4,5\}$ versus $\{3,4,5\} \cap \{1,2,3\}$?

•
$$\{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\},\ \{3,4,5\} \cup \{1,2,3\} = \{1,2,3,4,5\}$$

- Order of union does not matter
- What about $\{1,2,3\} \cap \{3,4,5\}$ versus $\{3,4,5\} \cap \{1,2,3\}$?
- Both are {3}.

•
$$\{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\},\$$

 $\{3,4,5\} \cup \{1,2,3\} = \{1,2,3,4,5\}$

- Order of union does not matter
- What about $\{1,2,3\} \cap \{3,4,5\}$ versus $\{3,4,5\} \cap \{1,2,3\}$?
- Both are {3}.
- $A = \{1, 2, 3\}$, and $B = \{3, 4, 5\}$. Compare $A \cap B$ and A B.

- $\{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\},$ $\{3,4,5\} \cup \{1,2,3\} = \{1,2,3,4,5\}$
- Order of union does not matter
- What about $\{1,2,3\} \cap \{3,4,5\}$ versus $\{3,4,5\} \cap \{1,2,3\}$?
- $\bullet \ \ \text{Both are } \{3\}.$
- $A = \{1, 2, 3\}$, and $B = \{3, 4, 5\}$. Compare $A \cap B$ and A B.
- $A \cap B = \{3\}$ and $A B = \{1, 2\}$

•
$$\{1,2,3\} \cup \{3,4,5\} = \{1,2,3,4,5\},\ \{3,4,5\} \cup \{1,2,3\} = \{1,2,3,4,5\}$$

- Order of union does not matter
- What about $\{1,2,3\} \cap \{3,4,5\}$ versus $\{3,4,5\} \cap \{1,2,3\}$?
- Both are $\{3\}$.
- $A = \{1, 2, 3\}$, and $B = \{3, 4, 5\}$. Compare $A \cap B$ and A B.
- $A \cap B = \{3\}$ and $A B = \{1, 2\}$
- $\bullet \ A = (A \cap B) \cup (A B)$

6.1: Summary

• Today we learned about sets, union, intersection, and difference.

You are now ready to complete 6A. Better try 6B now.

Make sure to take advantage of office hours
