## **Section 7.2: Integration by Parts**

We saw that integration by parts is the product rule in integral form.

Example

We also recall the following general formula:

#### Rule for Integration by Parts

If f(x) and g(x) are differentiable functions, then

$$\int f(x)g'(x) dx = f(x)g(x) - \int f'(x)g(x) dx;$$

$$\int_{a}^{b} f(x)g'(x) dx = f(x)g(x)\Big|_{a}^{b} - \int_{a}^{b} f'(x)g(x) dx.$$

Lecture 5

### Example 1

A particle that moves along a straight line has velocity

$$v(t) = t^2 e^{-2t}$$

meters per second after t seconds.

How many meters will it travel during the first t seconds?

# **Example 2** (Online Homework # 9)

Suppose that f(1) = 4, f(4) = 6, f'(1) = -5, f'(4) = -5, and f'' is continuous. Find the value of

$$\int_1^4 x f''(x) dx.$$

# **Example 3** (Problem # 8, Section 7.2, page 372)

Evaluate the indefinite integral:

$$\int 3xe^{-x/2}\,dx.$$

# **Example 4** (Online Homework # 6)

Find the integral: 
$$\int_0^1 x^2 \sqrt[4]{e^x} \, dx.$$

**Example 5** (Problem # 35, Section 7.2, page 373)

Evaluate the indefinite integral:  $\int \frac{1}{x} \ln x \, dx.$ 

$$\int \frac{1}{x} \ln x \, dx$$
.

Example 000000 **Example 6** (Problem # 48, Section 7.2, page 373)

Evaluate the definite integral: 
$$\int_0^1 x^3 \ln(x^2 + 1) dx.$$

# **Useful aside:** Trigonometric addition formulas

■ We also used the double angle formulas

$$\cos(2\alpha) = \cos^2 \alpha - \sin^2 \alpha \qquad \sin(2\alpha) = 2\sin \alpha \cos \alpha$$

$$= 2\cos^2 \alpha - 1 \qquad \text{and}$$

$$= 1 - 2\sin^2 \alpha$$
to compute 
$$\int \cos^2 x \, dx \quad \text{and} \quad \int \sin x \cos x \, dx.$$

- Is there a 'simple' way to remember formulas of this kind?
- **Euler's formula** establishes the fundamental relationship between the trigonometric functions and the complex exponential function. It states that, for any real number x,

$$e^{ix} = \cos x + i\sin x,$$

where i is the imaginary unit  $(i^2 = -1)$ .

http://www.ms.uky.edu/~ma138

■ For any  $\alpha$  and  $\beta$ , using Euler's formula, we have

$$\cos(\alpha + \beta) + i\sin(\alpha + \beta) = e^{i(\alpha + \beta)}$$

$$= e^{i\alpha} \cdot e^{i\beta}$$

$$= (\cos \alpha + i\sin \alpha) \cdot (\cos \beta + i\sin \beta)$$

$$= (\cos \alpha \cos \beta + i^2 \sin \alpha \sin \beta)$$

$$+ i(\sin \alpha \cos \beta + \cos \alpha \sin \beta).$$

■ Thus, by comparing the terms, we obtain

$$\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$$
$$\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta.$$

■ Thus, by setting  $\alpha = \beta$ , we obtain

$$cos(2\alpha) = cos^2 \alpha - sin^2 \alpha$$
 and  $sin(2\alpha) = 2 sin \alpha cos \alpha$ .
