Describing ~~plane curves~~.  
circles.

1.  $x^2 + y^2 = 1$ . The unit circle is the collection of points  $(x, y) \in \mathbb{R}^2$ .

$$x^2 + y^2 = 1.$$

- Implicit representation.  $a \leq t \leq b$ .

## 2. Graph of $\pm$ functions

$$y = \pm \sqrt{1-x^2}$$

## 3. Parametric curve.

$$(\cos(t), \sin(t)), 0 \leq t \leq 2\pi.$$

---

Plane curve.

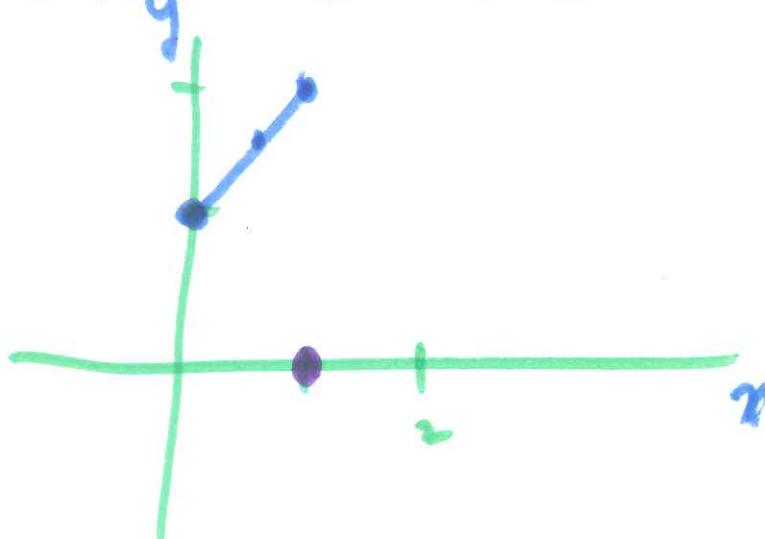

If  $f, g$  are continuous functions... then we may define a curve by  $x = f(t), y = g(t)$

Example.

$$x(t) = t, \quad y(t) = t^2 + 1$$

$t$	$x$	$y$
0	0	1
$\frac{1}{2}$	$\frac{1}{2}$	$\frac{3}{2}$
1	1	2

The points  $(\underline{0}, 1)$ ,  $(\underline{\frac{1}{2}}, \frac{3}{2})$   
 $(1, 2)$  are on this curve

Example

$$x(t) = t+1, \quad y(t) = t^2 + 3t.$$

Find an equation in  $x, y$  which contains the curve.

Eliminating the parameter  $t$ .

$$x = t+1, \quad y = t^2 + 3t.$$

Choose one equation to solve for  $t$ . (Pick the easier one).

$$t = \underline{x-1}$$

Substitute the expression for  $t$  into the other equation

$$y = t^2 + 3t$$

$$= (x-1)^2 + 3(x-1)$$

$$= x^2 - 2x + 1 + 3x - 3$$

$$= x^2 + x - 2.$$

## REF #2.

Eliminate  $t$  to find an equation whose graph contains the curve

$$(x, y) = (2t+1, t^2).$$

Solution.

$$2t+1 = x, \quad \cancel{t = \frac{1}{2}}$$

$$t = \frac{1}{2}(x-1)$$

$$y = t^2 = \left(\frac{1}{2}(x-1)\right)^2$$

$$= \frac{1}{4}(x^2 - 2x + 1).$$

Find a parametric description of the line through  $(1, 2)$  with slope  $-2$ .

Find another -

---

Solution 1: use point slope

$$y - 2 = -2(x - 1)$$

$$\begin{aligned}y &= -2x + 2 + 2 \\&= -2x + 4.\end{aligned}$$

Let  $x = t$

$$(t, -2t + 4).$$

---

Solution 2

$$x = 1 + t, y = 2 - 2t.$$

$$\text{Slope} = \frac{\text{change in } y}{\text{change in } x}$$

Solutions

$$\text{Try } x = 42t.$$

$$\begin{aligned}y &= -2x + 4 \\&= -2(42t) + 4\end{aligned}$$

$$= -84t + 4$$

## Circles.

$$x = \cos(t), y = \sin(t)$$

describes the unit circle w/ center 0.

---

$$x = a \cos(t), \\ y = a \sin(t)$$

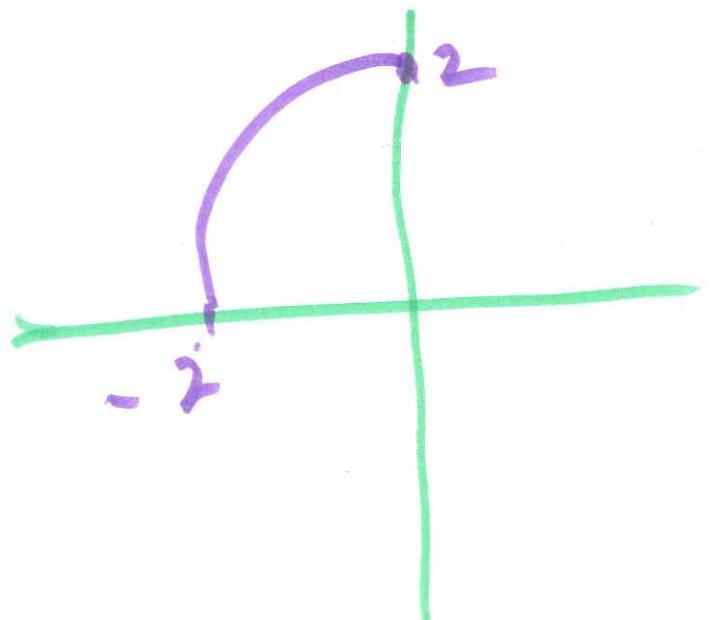

Describes a circle of radius  $a > 0$ .

$$x = h + a \cos(t) \\ y = k + a \sin(t)$$

has center  $(h, k)$   
radius  $a > 0$ .

---

Example. Find a parameter description of the part of the circle of radius 2 center b that lies in the 2<sup>nd</sup> quadrant.

Find a parametric rep.  
q file do p half 1 the  
ellipse

$$\frac{x^2}{4} + \frac{y^2}{9} = 1.$$

$$x = 2 \cos(t)$$

$$x = 2 \cos(t), y = 3 \sin(t)$$

$$\frac{(2 \cos(t))^2}{4} + \frac{(3 \sin(t))^2}{9}$$

$$= \cos^2(t) + \sin^2(t) = 1.$$

$$0 \leq t \leq \pi, \text{ then } x \geq 0.$$

$$y = 2 \sin(t)$$

$$\frac{\pi}{2} \leq t \leq \pi.$$

A batted ball travels along the curve

$$x(t) = 20t$$

$$y(t) = 1 + 30t - 5t^2$$

will it make it over a fence 110 m from the origin?

$x=0$  to  $3 \frac{m}{s}$  high.

$$x = 110$$

$$20t = 110 \text{ or } t = 5.5 \text{ s.}$$

$$y = 1 + 30 \cdot 5.5 - 5(5.5)^2$$

$$y(3) = 14.75 > 3.$$

Yes.
